

ABSTRACT

After entering a transparent substrate 9 of an organic EL device and passing through this substrate 9, an outside light L1 further passes through a transparent electrode 10 and an organic light emitting layer 12 to be reflected by a reflective electrode 13. Here, the reflective electrode 13 has irregularities and therefore the outside light L1 is diffused and reflected by this at various angles. These reflected lights are further diffused when passing through an irregularity surface 11 of the transparent electrode 10, and outgo from the transparent substrate 9 toward a liquid crystal panel. On the other hand, lights L2 to L4 emitted from the organic light emitting layer 12 are diffused when passing through the irregularity surface 11 of the transparent electrode 10, and outgo from the transparent substrate 9 toward the liquid crystal panel.
